

Fork Positioner for Forklifts

Forklift Fork Positioner - The fork positioner is a hydraulic apparatus that allows the person driving to be able to operate the forklift without leaving the seat. They are constructed out of high quality materials and are meant to be able to endure the most difficult operations and work environments. Side shifting models have the extra ability to be able to laterally position the entire load or the arms in order to facilitate more accurate lifting and placement in a quicker and more efficient method.

The blade pocket is somewhat unique and can enable the operator to be able to securely sway the blades into position without any fear of damaging the positioning cylinders. This can allow the operator the option to be able to perform simultaneous or independent fork movement, depending on the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are necessary. Standard OEM carriages could be converted into fork positioners on existing units.
